

CABLE PROTECTION DUCTS

You stand for our success

New technologies guarantee the improvement and innovation of our products. For you.

KOPOS KOLÍN a.s. is a leading manufacturer of wiring material with over 90 years of tradition. We currently produce over 5 000 products. The plastic category includes wiring boxes, mini trunkings, parapet (wall) trunkings, rigid or flexible pipes, double wall protector conduits (registered business mark KOPOFLEX® and KOPODUR® system), divided cable duct KOPOHALF®.

We also produce cable management systems such as cable trays, MARS, cable trays, JUPITER®, wire trays or a stainless steel program.

With the increasing demands on safety of buildings, we have expanded and introduced systems to maintain functionality in the fire. Choose from a variety of carefully tested systems.

The company considers it natural to produce products from halogen-free materials. By replacing lead in plastic mixtures and

other environmental activities, we don't want to stand out in the environmental protection.

The products comply with the requirements of the European standards and are tested in the electrotechnical institutes.

The company also owns a production technology used for the production of NEUTROSTOP shieldings. Their use is important especially on places where it is necessary to protect the environment from the neutron radiation.

We sell our products around the world through 11 daughter companies. KOPOS KOLÍN a.s. is a holder of certificates according to ISO 9001 and ISO 14001, Czech Quality and Safety Certificate.

Corrugated double-wall cable ducts KOPOFLEX® and KOPODUR®

The duct system KOPOFLEX® and KOPODUR® offers a wide range of applicability. It is particularly suitable for the mechanical protection of all kinds of power and telecommunication cables.

Benefits of double-wall cable ducts compared to other duct types:
Benefits of the materials used:

- polyethylene, the material of the ducts, offers high resistance to aggressive substances
- possible use in the chemical industry
- halogen-free material
- suitable for the protection of water pipes
- different colours
- possible design with high UV stability
- the zero content of asbestos protects human health

Benefits of the unique method of a double-wall ducts production:

- the double wall and the corrugated shape provide high resistance under compression

- possible change of the description on the pipe
- easy handling with the ducts when loading and re-loading

KOPOFLEX® - high flexibility

KOPODUR® - high rigidity

Installation benefits:

- can be installed directly in the soil, with no need of a sand bed

- possible installation directly in concrete
- a slip-over coupling seals the duct joint on IP 40

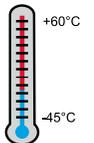

- sealing rings fitted on both ends of the duct protect the joint against humidity and temporary flooding with water (IP67)

- well-arranged installation in multiple layers and rows thanks to the distance spacers

- broad temperature range for application

- when installing, it is advisable to use at least 1 empty extra pipe in case that additional cables are needed in future

Benefits for inserting cables:

- the slight wall corrugation allows easy cable insertion and reduces friction by up to 30%

- the smooth inner surface (compared to concrete pipes) eliminates the possibility of cable damage

- a pull-through string ensures easy cable insertion

Icons - capture

- flexible doublecoat corrugated pipe

HDPE

storage: -45- +60°C
montage: -5 - +60°C

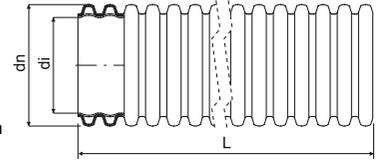

A1

450 N/20 cm

IP40

- ▶ Halogen-free flexible double-coated pipe designed for mechanical protection of all kinds of power and data wiring.
- ▶ The pipes are made in compliance with ČSN EN 61386-24.
- ▶ Each coil is equipped with a pull-through string or wire that ensures easy cable insertion and a coupling on one end.
- ▶ When using a sealing ring, the protection class is IP 67.
- ▶ The product may have common surface mechanical damage (crumpling, scratches, deformations of the ribs) to the outer wall of the pipe caused by production or transport technology, which does not affect the functionality of the product.

Accessories for corrugated pipes KOPOFLEX® and KOPODUR®

-45 - +60°C

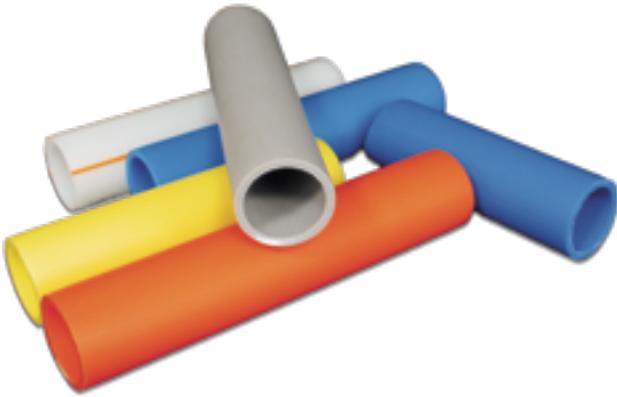

- Couplings** - slip-over couplings are the same for both types of pipes and are used to join the pipes.
- Sealing rings** - the same for both types of pipes and are used to seal the joint to prevent it against humidity and water.
- Closing plugs** - for blinding of backup lines and for temporary blinding of pipes when installing.
- Distance spacers** - for position fixation of several pipes in one excavation.
Distance spacers serve for fixation 8 pipes and spacer can be split for fixation 2, 4 and 6 pipes. Per order only.

HDPE communication cable ducts

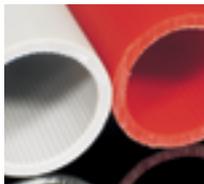

Single-wall protection ducts for fibre-optic and metallic cables.

As requested by the customer:

Colour strips facilitate cable identification when several protection ducts are installed in a single excavation.

► The shape of longitudinal grooves ensures easier air-blown installation of cables.

► The ducts can be provided with some text (including length indications).

► The ducts are supplied in harnesses 100 m or 300 m long.

To create a line, it is possible to connect the individual harnesses with couplings.

For larger line sections, a 1750 m package is also available (for the dimension 06050 - 1250 m), supplied on wooden drums.

KOPOS KOLÍN a.s. supplies fibre-optic cable ducts even in large harnesses of 2000 m (06040) and 1250 m (06050) for installation on unwinding metal drums.

When the drum side plate is removed, the coil is slid onto the drum, the side plate is replaced and the drum is ready for unwinding.

The advantage of this solution consists in cost savings thanks to the transport of a larger quantity of wooden drums.

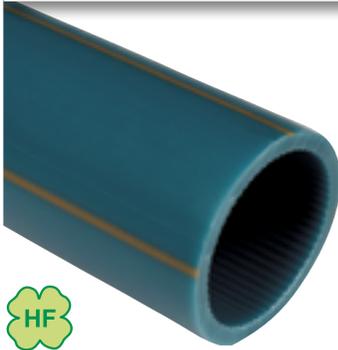

The air-blown installation technology allows the installation of fibre-optic cables with an outer diameter of 6,5 to 32 mm in suitable protective pipes made of polyethylene by means of a large air mass.

Thanks to the generated laminar air flow in the duct and the additional mechanical cable drift inside the duct, the fibre-optic cable is carried and moved forward. With a good technological procedure, it is possible to air-blow very long fibre-optic cables in ducts, even exceeding 2000 m. A huge advantage of this method is a very careful installation of the cables - without any pulling force. KOPOS KOLÍN a.s. does not install the ducts; please contact a provider of such services who possesses the necessary technology for duct installation and cable airblowing.

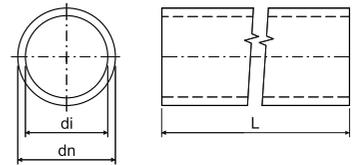

Optical cable protectors HDPE

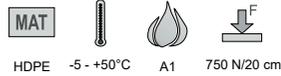

HDPE
 -5 - +50°C
 A1
 750 N/20 cm

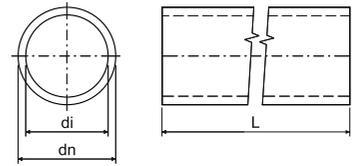

- ▶ Single-coated pipes designed to protect cables with optical fibers under the ground.
- ▶ For larger volumes different color versions (beyond presented versions), labeling, number of distinctive stripes, denticular inner surface or inner diameter size (material thickness) can be ordered based on customer needs and specifications.
- ▶ Shock resistance: N (normal, ČSN EN 61386-24)
- ▶ Bend resistance: flexible
- ▶ The protectors are tested under pressure of 1,5 MPa for the time of 1 hour.
- ▶ The packaging on wooden drums and pallets for unwinding drums is delivered just upon previous order according to the customers's specification.

Optical cable protectors from recycled HDPE

- ▶ Single-coated pipes designed to protect cables with optical fibers under the ground.
- ▶ Inner material - recycled HDPE.
- ▶ For larger volumes different color versions (beyond presented versions), labeling, number of distinctive stripes.
- ▶ Shock resistance: N (normal, ČSN EN 61386-24)
- ▶ Bend resistance: flexible
- ▶ The protectors are tested under pressure of 1,5 MPa for the time of 1 hour.
- ▶ The packaging on wooden drums and pallets for unwinding drums is delivered just upon previous order according to the customer's specification.

KOPOHALF®

- divided cable duct

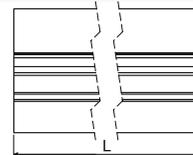

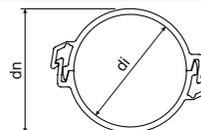

HDPE

 storage: -45- +75°C
 montage: -5 - +75°C

A1

 06110/2 - 450 N/20 cm
 06160/2 - 750 N/20 cm

IP30

- ▶ A system of divided cable ducts is suitable mainly for a protection of underground cable laying and for a laying-out of the energy and communication lines.
- ▶ Another possible application is a protection of already installed underground cables.
- ▶ The protectors consist of two identical parts.
- ▶ When installing, the cables are put in the bottom part and then the top part is snapped onto the bottom one.
- ▶ Connecting of protectors is performed by overlapping joined lower parts with an upper part at length of approximately 30 cm.
- ▶ The divided cable ducts are manufactured and tested in accordance with standard ČSN EN 61386-24.

KOPOKAN - inground channel

MAT
 PVC -5 - +60°C A1 - F 30 sec. IP30

- ▶ Inground channels are intended for mechanical protection of installation of engineering networks to be loaded under the ground.
- ▶ By its technical parameters those fully replace the earlier used concrete channels.
- ▶ It is possible to use them for an additional protection of already installed inground engineering networks.
- ▶ Floor trunkings are supplied with a colour lid.
- ▶ Connected using connectors and folding the lid over, thus interconnecting the individual parts.
- ▶ Strength limit on compression tested on length 300 mm.
- ▶ Inground channels are manufactured according to ČSN EN 61386-1 and ČSN EN 61386-24.

Storage cable ducts

UV-stable corrugated protection ducts KOPOFLEX® can be stored on open, hardened surfaces. Other cable ducts (KOPOFLEX®, KOPODUR®, fibre-optic cable ducts HDPE, KOPOHALF® and KOPOKAN) can be stored on open, hardened surfaces, but have to be protected against the long-term effects of the sunlight. All duct accessories are to be stored in covered halls.

DOCUMENTS FOR DESIGNING PLASTIC CABLE DUCTS

Prepared by: Ing. Petr Lehký
Helena Kváčová

Head of Department: Ing. Petr Lehký

Director: Ing. Zdeněk Špaček, CSc.

INTRODUCTION

Maximum load value determined in the document for the projection of plastic cable ducts is based on "Dimensioning Cable Ducts" methodology that has been prepared for the sphere of power engineering.

Following tables specify the total load values for individual types of surface loading, including the influence of dynamic effects and the load resulting from the soil weight.

The cases of exceeding the permissible load (for the assortment of cable ducts offered) are printed in bold and shaded.

The load capacity of cable ducts has been determined with regard to max. 5% deformation. Cable ducts passing through a track bed may not be deformed by more than 3%. It implies that the load may not exceed the value of permissible stress at the deformation of 3 %.

The permissible load on cable ducts has been determined based on their ring stiffness set in accordance with ČSN EN ISO 9969.

- Road Transport Class A: 240 kN (120 kN per wheel)
- Road Transport Class B: 165 kN (82,5 kN per wheel)
- Tram Transport: 120 kN (60 kN per wheel)
- UIC 71 - Single and Double Track: 250 kN (125 kN per wheel)
- Entrances 40 kN (20 kN per wheel)

KF 09040

XXXX

Highlighting the cases, when channels fail to meet the requirements or their use is on the limit of permissible load.

1. JOINING PROTECTIVE PIPES

- ▶ The protective pipes are connected using the 02xxx_FA coupling. The coupling is a part of every coil (KOPOFLEX®) or stick (KOPODUR®).
- ▶ Insert the end of the protective pipe as far as it goes into the coupling. This connection guarantees IP 40 protection.
- ▶ Two 16xxx_FB sealing rings must be used for the watertight connection of the protective pipes.
- ▶ Lubricate the sealing ring with a lubricant and insert it into the second groove at the end of the protective pipe. We will do the same at the end of the second one.
- ▶ Insert the end of the protective pipe with the sealing ring as far as it goes into the coupling.
- ▶ This connection guarantees IP 67 protection. We offer sealing rings up to a diameter of 110 mm.

2. LAYING OF PROTECTIVE PIPES

It is recommended to cover KOPOFLEX® and KOPODUR® protectors with soil with grains up to a size of 50 mm in a volume of max. 10% in the soil.

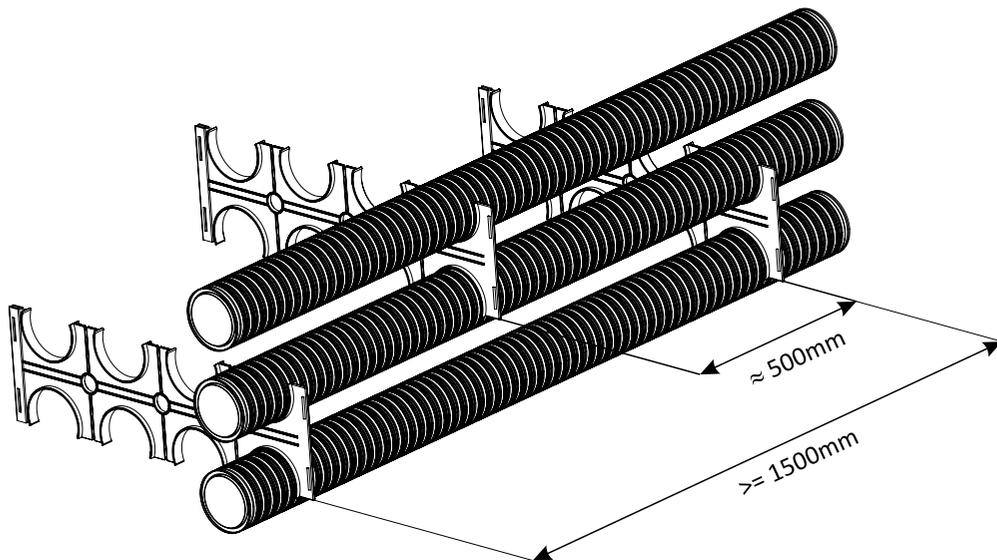

Detailed conditions are set by the ČSN EN 1610 standard, which replaces the no longer valid ČSN 73 30 50. We present the description of the soil according to the already invalid standard, because it well describes the character of the soil:

- a) cohesive, soft consistency. e.g. topsoil, clay, sandy clay, loamy sand
 - b) incoherent, loose grains up to 20 mm with grains over 20 to 50 mm in a volume of up to 10% of the total volume of 1st class soil, e.g. sand, sand with gravel, sandy gravel, small and medium gravel, or gravel with stones
 - c) construction waste and weighing of a similar nature as soils included in the 1st class.
- ▶ Sprinkle the protective pipe on both sides, compactable with soil without stones, in layers of max. 30 cm. The guards must not be pushed to the sides during the compaction.
 - ▶ For multi-layer laying in the excavation, we place each layer of protectors separately (fill and compact), only then can we lay another layer.
 - ▶ When concreting, we pay attention to the watertight connection of the protective pipes (using sealing rings inserted into the second groove) and secure the protectors against buoyancy! We choose such aids to prevent the damage of the protective pipe.

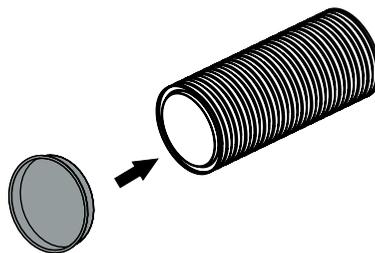

3. SPACERS

- ▶ In case of a multi-layer pipe installation, we install spacers for fixing the pipes.
- ▶ When using the spacers, we have to use spacers up to a maximum of 1.5 m.
- ▶ When we use spacers, we have to use a sand bed and cover all the layers of the protective pipes with sand in order to compact the layers.
- ▶ There must be no air pockets between the individual layers, otherwise the protective pipes would be deformed during the compaction.
- ▶ Spacers can be connected horizontally. In the vertical direction, the spacers cannot be connected, but we solve this by moving the spacers by about 0.5 m and then installing another layer of protectors - it is always necessary to cover the protectors with sand.

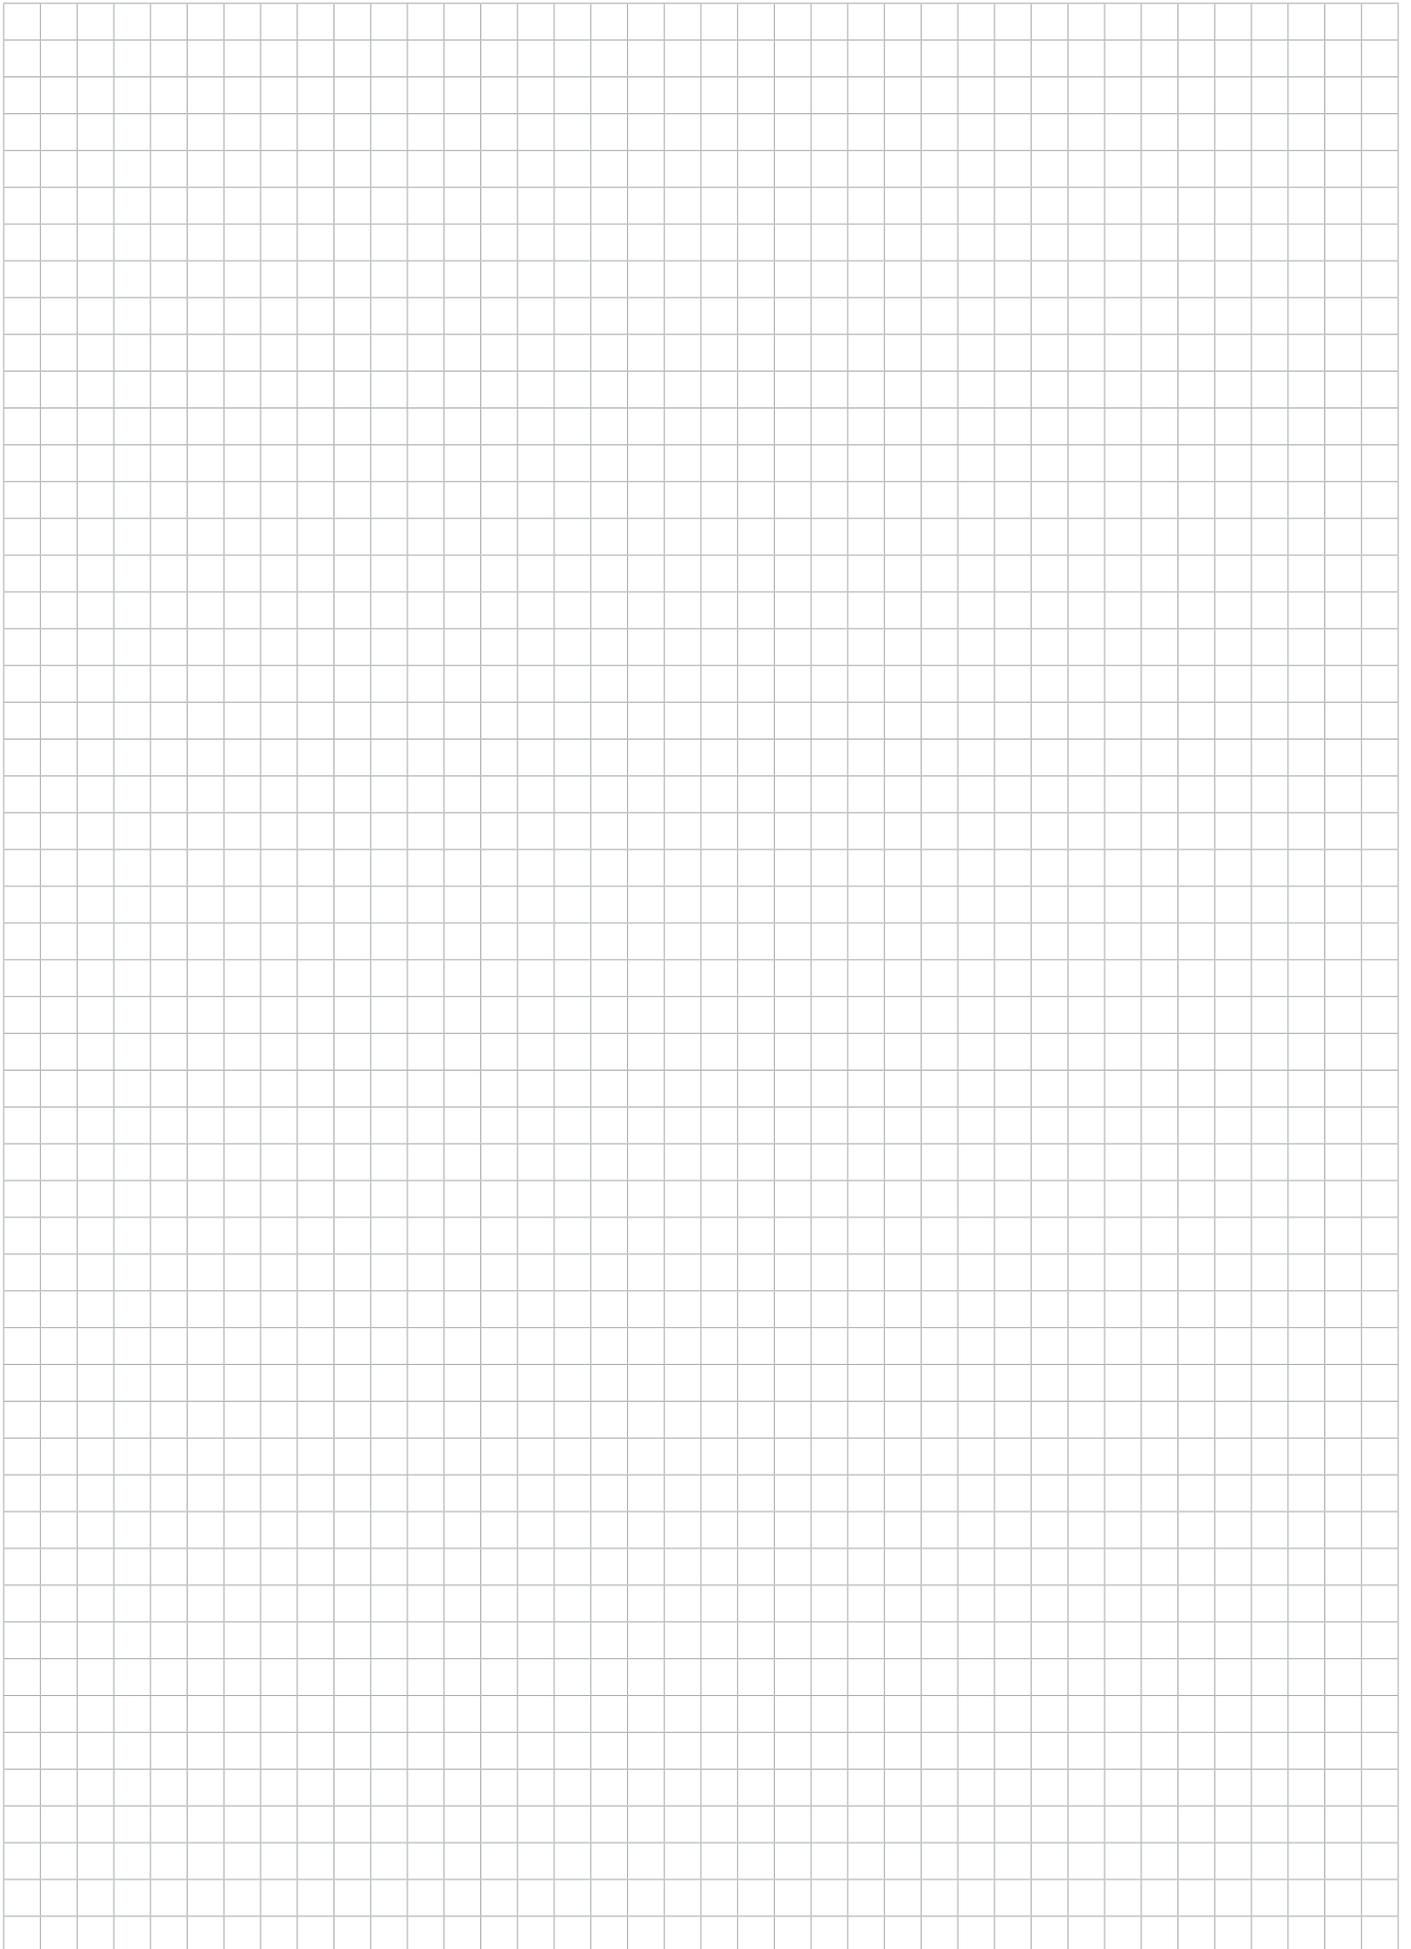

4. PLUGS

- ▶ The plugs are intended for blinding backup lines or for temporary blinding of guards during installation.

5. STRETCHING STRING

- ▶ The supplied stretching blue string in the KOPOFLEX® protective pipe is used to pull in the wire, resp. cable of the retracted cable. Before laying the protective pipes, always loosen the end of the string attached to the protector. If we do not need a stretching string, we will pull it out of the protective pipe before its assembly.
